ACET Junior Academies'

Scheme of Work for Science

Big Idea - Materials Year 2 – Uses of Everyday Materials

About this unit:

PoS – Uses of everyday materials

This unit builds on the Y1 'Everyday materials' unit. There the students should have learnt to differentiate between an object and the material from which it was made, and to be aware that different materials have different properties. Some students will have developed the ability to describe the properties of materials. This ties in with other work in Y1 – Identifying animals, and work that has been done in Y2 when looking at habitats. In all of these cases, the focus has been on identifying features of living things, or properties of materials, and using key terms to describe them.

Students are now going to move to the next level, which is to look at the different ways in which we use materials. In Y5, they will move on to link the properties and uses of materials; in Y2 they don't need to say 'why' we use a material in a particular way, but they need to develop an awareness of all the possible uses, and be constantly reminded that different materials have different properties, and that we can use key terms to describe them. Use opportunities to remind students where they have done this before, to illustrate that this is a particular way of working in science.

There are lots of opportunities to develop investigative skills in this unit.

The students will need to go outside to gather information for their year book, and continue the study of the habitats that they began in Autumn.

Unit structure

This unit is structured around seven science enquiries:

- 1. What do you remember about materials?
- 2. What are materials used for?
- 3. Is it fit for purpose?
- 4. How can we find out more about properties?
- 5. Are materials always the same?
- 6. Investigating the differences between materials
- 7. What about wood?

Links to previous and future National Curriculum units

Y1 – Everyday materials	 EA – Comparative/fair testing Asking questions Making predictions Observing and measuring Key concepts: Most objects are made from two or more materials. Each material has a different job to do for the object 	+	 Can your children: Identify objects which are made from two or more materials Suggest a material for a certain purpose 	Horizontal: Vertical: Y5 – Properties and changes of materials
Key terms		Common misconceptions		
Wood, metal, ceramic				
Suggested activities		Resources	Useful links	
 Wood, metal, ceramic, plastic, rock, fabric, glass, hard, soft, shiny, waterproof, strong, flexible/bendy Suggested activities Spot different materials in the room. Now look at different objects around he room – how many are made from only one material, and how many are nade from two or more materials? Most objects are made from two or more materials, and each material does a specific job. Show the students a pan (it should be metal, with a wooden handle). Why is that all made of wood? Why is not all made of metal? Why isn't it made of plastic? You could show videos of wood and plastic burning/melting to illustrate why making a pan out of these materials isn't a good idea. Demonstration – why is the handle made of wood, not metal? Prepare three spoons – plastic, metal, wood – of a similar size, and short, if possible, with a small blob of butter on the top of the handle. Place the poons into a bowl of hot water. Which butter melts first? If we made the handle of a pan from metal, we would burn our hands! Use the demonstration to reinforce the idea of scientists using evidence. The poons in hot water proves that metal carries heat along it faster than wood and plastic. 		Metal pan with wooden handle 3 spoons of similar size – wood, metal and plastic Butter Bowl of hot water	https://www.youtube.co E Spoons and butter	om/watch?v=pVwWjsabDX

Suggested activities		Resources	Useful links		
Elastic band, balloon, sock, aluminium foil, sponge, modelling clay. Demonstrate pulling an elastic band. What happens when you stop pulling? What happens when you blow up a balloon? And when you let the air out? Students to investigate sock, foil, sponge and clay. Before you start, get the class to consider how they will record their results. THEY DO NOT NEED TO DO THIS INDIVIDUALLY, however it's a good discussion to have. Make sure each group has a way of recording their results before they start – they don't need to have designed, or even drawn, a table themselves. Can you stretch it? Does it go back to its original shape when you stop? Can you stretch it? Does it go back to its original shape when you stop? Choose a material to make a model with – you can use a combination if you like. Make a model by using a combination of the materials you have been given. You need to explain how you made your model – which bits did you squash, squeeze or twist to make the shapes you want?		Elastic band, balloon, sock, aluminium foil, sponge, modelling clay.			

Enquiry 5: Are materi	als always the same?			
Links to previous learning	Scientific skills		Assessment criteria	Curricular links
Y1 – Everyday materials	EA – Pattern seeking Asking questions Making predictions Observing and measuring Recording data Interpreting and communicating data Key concepts: A material, e.g. metal, can have different properties depending on the shape it's in. When scientists have carried out an investigation, they need to be able to clearly tell someone else what they found out.		 Can your children: Describe a way which a scientist might use find out about the properties of a material Tell you what they found out in today's investigation 	Horizontal: Vertical: Y5 - Properties and changes of materials
Key terms		Common misconceptions		·
Hard, strong, shiny, c scratch, change sha	onduct, carry heat, carry electricity, heavy, light, pe, break	'Hard' means how difficult it is to easily.	o scratch. Strong means	it doesn't get broken
Suggested activities		Resources	Useful links	
Similar metal of different sizes – foil, wire, block (any kind of 'chunk', even a substantial spoon will do). Also some different types of metal. Are they all metal? How do you know? <i>Review Y1 – what makes a metal?</i> The focus of today's lesson should be to communicate a conclusion . In order to do this, students need to have discussed 'What we're trying to find out', and 'What we think the answers will be'. These do not need to be recorded in any way – just that students have an awareness of them when presenting their conclusions. Are all metals the same? Things to investigate: Hardness – how difficult it is to scratch Strength – how difficult it is to break Shiny Mass (how heavy it is – it may be difficult to compare this if the size of the objects are different) *Conducting heat (see the demonstration with spoons in hot water) *Conducting electricity (set up a circuit with a lamp and two crocodile clips)		Similar metal in 3 forms – foil, wire, block (any 'chunk' of metal will do for comparison – even a substantial spoon). Also some metals that are obviously different – steel, copper, iron A circus of stations to investigate different properties – see left
